const [postData, setPostData] is a "native" built-in function! Why not test it by importing the whole function, ★ We already have creator, we don't have title, we do have message, from which imports tags, and we still have pages/actions/posts.js

Here we are doing import * as api from ../api/index.js.

index.js is a place to index.js is in social/client/src/api/index.js, originally.

★ Instead of pages/api/index.js, we can access pages/actions/posts API js. Moves it to these.

We have imported users.js, posts.js postsAPI.js and (unused) styles.js. We are making some kind of comparison between pages/users.js and social/client/src/components/Form/Form.js. The currentId is actually passed as a property to pages/users.js.

Form.js is being imported from social/client/src/app.js
★ Only using getPosts from './actions/posts'; and therefore, since we turned api.fetchPosts() into export const getPosts, we know how to effectively fetch new posts, deal with the existing posts. Module not found: Can't resolve './components/Posts/Posts'.

★ Moved: social/client/src/components/Form/Form.js in the original tutorial... to pages/users.js.
Moved: social/client/src/actions/posts.js in the original tutorial... to pages/actions/posts.js
Moved: social/client/src/api/index.js from the tutorial that is memories-project to pages/actions/postsAPI.js
Moved: We did import, to pages/src/styles.js. These are in a category of their own!

Remembers the pages/api/users.js, that initializes the firebase APP. all it does is await db.collection randomize

Don't touch. just focus on pages/users.js. We have moved the /actions folder to still, as before, meet the working directory... and finally we Move social/client/src/

components/Posts/Posts.js to "pages/components/Posts/Posts.js".

Whoops. Importing Posts in users.js leads to importing Post in Posts. Instead of closing the importing of a file structure let's create Post.js adjacent with after spinning Posts.js both; in pages/components/Posts/ folder; it's a directory!
A post within a Post means...pts
